

Karst Topography

In many areas of Leon, Jefferson and Wakulla counties, limestone is at or near the land surface and, as a result, the Foridan Aquifer may be **recharged** quickly. **Recharge** is the process by which water is added to the aquifer by

seeping through the overlying soils. Rain water percolates into the aquifer and can easily become contaminated by nonpoint pollution as well as by careless dumping of oil, gas, household and industrial wastes.
